Hi Frances,

Good question – the answer is complex. I'm hoping the attached criteria might be helpful.

Laura

Would any of these alternatives be better in some significant way than the contained burn unit being proposed for Clean Harbors (absent OB/OD)?

Thanks, Brian. The information helps much to have a perspective of the equipment required to actualize a competent disposal facility for eradication of hazardous materials. Good reference to the "improved facility" at El Dorado.

Harbors has no competitive disposal business. Expense is not a factor, as the only such-disposal business in the US, they can charge whatever required for the various materials. Shortfall of effective technology is no factor for such business.

Relatedly, the military is slowly beginning to reckon with the very same open-pit/detonation on bases, which have impacted service people conducting such ops .. as per my observation in items from the Veteran of Foreign Wars magazines. Presumably, effective disposal by Harbors, could include a waste stream from military bases, and enlarge their income by many times.

Here are my thoughts about the open burning of hazardous chemicals near Colfax, Louisiana. It's a far more complex problem than the remediation problem at Camp Minden was. While Camp Minden was largely focused on the removal of a homogeneous organic chemical waste stream (M6 and CBI), the Clean Harbors problem is far more diverse, involving both heavy metal organometallic compounds (with lead and cadmium), inorganic heavy metal compounds (with lead, mercury, and chromium-VI) perchlorate, and nitroaromatic organic compounds.

As well as ElDorado's burn chamber performed at Camp Minden, it alone could not handle the waste stream in Colfax. They would also need rotary kilns and sealed explosion chambers (e.g. DaVinch), each with its own custom-tailored pollution abatement systems. Also the real-time emissions monitoring would need to be state-of-the-art, something that was terribly lacking at Camp Minden.

Real-time monitoring using mass spectrometry is the way to go, in my opinion. Mass spec can do it all with the right ionization methods on the front end. All of this would take money, but Clean Harbors is still unwilling to make that investment, because Louisiana continues to allow them to open burn and open detonate of all of these hazardous materials in Colfax.

The technology keeps evolving, but Louisiana is stuck in the dark ages, with the poor continuing to suffer the most dire consequences.
